

QCD and Monte Carlo event generators

Monte Carlo course seminar - Milan, February 2021

UNIVERSITÀ
DEGLI STUDI
DI MILANO

- ① Hadron collisions and strong interactions
 - Hadron collisions and strong interactions
 - Renormalization group
 - IR divergences
- ② MC and Parton Showers
 - Factorization theorem
 - Final state radiation
 - Initial state radiation
- ③ Hadronization: some basics

Strong interactions

QCD from e^+e^- annihilation

Quantum Chromodynamics (QCD) \rightarrow theory describing the interaction between quarks and gluons (strong interactions)

QCD arises already from e^+e^- annihilation $\rightarrow R_0$ ratio

$$R_0 = \frac{\sigma(\gamma^* \rightarrow \text{hadrons})}{\sigma(\gamma^* \rightarrow \mu^+ \mu^-)} = 3 \sum_f c_f^2$$

- ❶ Color factor (3 color for each quark)
- ❷ Sum over charges of different flavors
- ❸ Threshold and higher order corrections

Strong interactions

QCD from e^+e^- annihilation

Questions for a field theory

- 1 Can we go to arbitrarily large energies? \rightarrow divergences arise, renormalization / factorization needed
- 2 Can we compute R_0 for every process? \rightarrow IR observables

Strong interactions

Renormalization group

- Running coupling given by Renormalization Group Equation (RGE)

$$\mu \frac{d\alpha_s(\mu)}{d\mu} = \beta(\alpha_s(\mu)) = - \sum_{n=0}^{\infty} \beta_n \left(\frac{\alpha_s}{\pi} \right)^{n+1}$$

- Coupling α_s evolves with scale μ as given by RGE \rightarrow LO behavior driven by β_0
- $\beta_0^{\text{QCD}} > 0 \implies$ weakly coupled at large energies, asymptotic freedom
- $\beta_0^{\text{QED}} < 0 \implies$ strongly coupled at large energies, UV divergent!

Strong interactions

Renormalization group

- Running coupling given by Renormalization Group Equation (RGE)

$$\alpha_s(\mu) = \frac{1}{b_0 \log\left(\frac{\mu^2}{\Lambda_s^2}\right)}$$

- β_0
- Λ_s

QCD is weakly coupled for $\mu \gg \Lambda_s \rightarrow$ asymptotically free

Perturbative Quantum Chromodynamics (pQCD)

Factorization theorem

QCD factorization

LHC processes $H_1 + H_2 \rightarrow F$

Separate process **PDFs** and **partonic (hard) interaction**

$$\sigma^F(p_1, p_2) = \int_0^1 dx_1 dx_2 f_\alpha(x_1, \mu_F^2) * f_\beta(x_2, \mu_F^2) * \hat{\sigma}_{\alpha\beta}^F(x_1 p_1, x_2 p_2, \alpha_s(\mu_R^2), \mu_F^2)$$

Parton showers

MC Parton showers

Partons in the initial and final state emit radiation. State Radiation (ISR) and Final State Radiation (FSR)

Shower Monte Carlo programs (HERWIG, PYTHIA)

- Libraries for computing SM and BSM cross sections
- Shower algorithms produce the parton shower from final state or initial state partons
- Hadronization models, underlying event, decays of unstable hadrons, etc

Parton showers

Collinear limit

- An emitted parton is collinear to an incoming or outgoing parton (θ small)
- Measurement not sensitive to such small scales
- σ dominated by collinear emission $q \rightarrow qg, g \rightarrow gg, g \rightarrow q\bar{q}$

Collinear factorization \longrightarrow Factor out tree level amplitude and splitting

$$|M_{n+1}|^2 d\Phi_{n+1} \Rightarrow |M_n|^2 d\Phi_n \frac{\alpha_S}{2\pi} \frac{dt}{t} P_{q,qg}(z) dz \frac{d\phi}{2\pi}.$$

Parton showers

Kinematics of splitting

- Kinematics of splitting (t, z, ϕ)
 - t has dimensions of energy (virtuality, p_{\perp} , angular variable)
 - z represents the fraction of momentum of radiated parton
 - ϕ represents azimuth of the k, l plane
- Factorization holds for small angles. Applied recursively

Parton showers

AP splitting functions

Altarelli-Parisi splitting functions

$$\begin{aligned}P_{q,qg}(z) &= C_F \frac{1+z^2}{1-z} \\P_{g,gg}(z) &= C_A \left(\frac{z}{1-z} + \frac{1-z}{z} + z(1-z) \right) \\P_{g,q\bar{q}}(z) &= T_f(z^2 + (1-z)^2)\end{aligned}$$

We can proceed in an iterative way

$$|M_{n+2}|^2 d\Phi_{n+2} = |M_n|^2 d\Phi_n \frac{\alpha_s(t')}{2\pi} P_{q,qg}(z') \frac{dt'}{t'} dz' \frac{d\phi'}{2\pi} \frac{\alpha_s(t)}{2\pi} P_{q,qg}(z) \frac{dt}{t} dz \frac{d\phi}{2\pi}$$

Exclusive final state: limit to the most singular terms, in ordered sequence of angles

Collinear approximation \longrightarrow Leading log approximation

Final state radiation MC

General structure

Approximated description of a hadronic final state. Model a given hard scattering with arbitrary number of enhanced radiations

- Choose hard interaction with specified Born kinematics.
- Consider all possible splittings for each coloured parton.
- Assign the variables t , z , ϕ at each splitting vertex, t ordered in decreasing way.
- At each splitting vertex assign the weight (...)
- Each line has a weight known as Sudakov factor (...)

Final state radiation MC

Formal representation of a shower

Approximated description of a hadronic final state. Model a given hard scattering with arbitrary number of enhanced radiations

Forward evolution equation

$$S_i(t, E) = \Delta_i(t, t_0)S_i(t_0, E) + \sum_{jl} \int_{t_0}^t \frac{dt'}{t'} \int_0^1 dz \int_0^{2\pi} \frac{d\phi}{2\pi} \frac{a_S(t')}{2\pi} \Delta_i(t', t_0) S_j(t', zE) S_l(t', (1-z)E)$$

Final state radiation MC

Probabilistic interpretation

$$S_i(t, E) = \Delta_i(t, \epsilon_0) S_i(t_0, E) + \sum_j \left[\frac{d\sigma_j}{dt} \right]_{t_0}^{t_1} \int_{t_0}^{t_1} \frac{d\phi}{2\pi} \Delta_j(t', \epsilon_0) S_j(t', zE) S_j(t', (1-z)E)$$

$$S_i(t, E) = \frac{t, E}{i} \bullet \text{---},$$

$$\frac{t, E}{i} \bullet \text{---} = \frac{t}{i} \bullet \text{---} \frac{t_2}{i} \bullet \text{---} + \frac{t}{i} \bullet \text{---} \frac{t'}{i} \bullet \text{---} \frac{t', zE}{j} \bullet \text{---} \frac{t', (1-z)E}{l} \bullet \text{---}$$

FSR IV - MC programs

Final state radiation MC

Shower algorithm

Generate hard process with probability proportional to its parton level cross section. For each final state colored parton:

- 1 Set scale $t = Q$, hard scale of the process
- 2 Generate random number $0 < r < 1$
- 3 Solve $r = \Delta_i(t, t')$ for t'
- 4 i) if $t' < t_0$, no further branching and stop shower
- 5 ii) if $t' \geq t_0$, one branching into partons j, l with energies $E_j = zE_i$ and $E_l = (1 - z)E_i$, z following the $P_{i,jl}(z)$ distribution and ϕ uniform in the interval $[0, 2\pi]$ (variables, ...)
- 6 For each branched partons set $t = t'$ and start from (2)

Initial state radiation MC

General structure

- Lines between t_1 and t_2 (consecutive radiations) are spacelike (*)
- Difference in Sudakov factors and Splitting functions start at NLO

$$\begin{array}{c} \text{---} \end{array}
 \begin{array}{c} t_0, E \\ i \end{array} \text{S} \begin{array}{c} m, t, xE \\ \end{array} = \frac{t_0}{i} \begin{array}{c} t \\ m \end{array} \delta_{\text{im}} \delta(1-x) + \begin{array}{c} t', zE \\ j \end{array} \text{S} \begin{array}{c} m, t, xE \\ \end{array} + \begin{array}{c} t', zE \\ j \end{array} \text{S} \begin{array}{c} m, t, xE \\ \end{array}$$

Diagram illustrating the general structure of initial state radiation (ISR) for a specific process. The equation shows the splitting of a line with momentum t_0, E into two terms. The first term is a Sudakov factor S with momentum t_0, E and a delta function $\delta_{\text{im}} \delta(1-x)$. The second term is a Sudakov factor S with momentum t', zE and a delta function $\delta_{\text{im}} \delta(1-x)$. The third term is a Sudakov factor S with momentum t', zE and a delta function $\delta_{\text{im}} \delta(1-x)$.

Initial state radiation MC

Formal representation

$$S_i(m, x, t, E) = \frac{t_0 E}{i} \text{S} \begin{array}{l} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array}$$

- Lines between t_1 and t_2 (consecutive radiations) are spacelike (*)
- Difference in Sudakov factors and Splitting functions start at NLO

Forward evolution equation. Great amount of computation time to generate configurations - $\hat{\mathcal{L}}$ the scattering that we want

$$\begin{array}{c} t_0, E \\ \text{---} \\ \text{S} \\ \text{---} \\ i \end{array} \begin{array}{l} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} = \frac{t_0}{i} \begin{array}{c} t \\ \text{---} \\ \text{---} \\ m \end{array} \delta_{im} \delta(1-x) + \frac{t_0}{i} \begin{array}{c} t' \\ \text{---} \\ \text{---} \\ i \end{array} \begin{array}{c} j \\ \text{---} \\ \text{S} \\ \text{---} \\ t', zE \end{array} \begin{array}{l} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} + \frac{t_0}{i} \begin{array}{c} t' \\ \text{---} \\ \text{---} \\ i \end{array} \begin{array}{c} l \\ \text{---} \\ \text{S} \\ \text{---} \\ t', (1-z)E \end{array} \begin{array}{l} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array}$$

Initial state radiation MC

Formal representation

$$S_i(m, x, t, E) = \frac{t_0 E}{i} \text{S} \begin{array}{c} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array}$$

- Lines between t_1 and t_2 (consecutive radiations) are spacelike (*)
- Difference in Sudakov factors and Splitting functions start at NLO

Backward evolution equation

$$\begin{array}{c} \sim \sim \sim \end{array} \quad \frac{t_0 E}{i} \text{S} \begin{array}{c} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} = \frac{t_0}{i} \underset{\delta_{im} \delta(1-x)}{\overset{t}{m}} + \frac{t_0}{i} \underset{i}{\overset{t'}{j}} \underset{i}{\overset{l}{\text{---}}} \begin{array}{c} t', zE \\ \text{S} \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \begin{array}{c} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \begin{array}{c} t', (1-z)E \end{array} + \frac{t_0}{i} \underset{i}{\overset{t'}{j}} \underset{i}{\overset{l}{\text{---}}} \begin{array}{c} t', zE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \begin{array}{c} \text{S} \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \begin{array}{c} m, t, xE \\ \text{---} \\ \text{---} \\ \text{---} \end{array} \begin{array}{c} t', (1-z)E \end{array}$$

Initial state radiation MC

Shower algorithm

Generate hard process with probability proportional to its parton level cross section. For each final state colored parton:

- ① Set scale t to Q , hard scale of the process
- ② Generate random number $0 < r < 1$
- ③ Solve (...) for t'
- ④ i) if $t' < t_0$, no further branching and stop shower
- ⑤ ii) if $t' \geq t_0$, one branching into partons j, l with energies $E_j = zE_i$ and $E_l = (1 - z)E_i$, z following the $P_{i,jl}(z)$ distribution and ϕ uniform in the interval $[0, 2\pi]$
- ⑥ For parton j (...), for parton l generate a timelike parton shower according to the algorithm shown previously

Hadronization

Basics

Hadronization

Lund string model

Hadronization

Clustering models

Parton showers and MC generators

Formal representation of a shower

Ensemble of all possible radiations as the sum of no radiation, with radiation and shower from radiated partons

- Ansatz for Sudakov

$$\Delta_i(t, t') = \exp \left\{ - \int_{t'}^t \frac{dt''}{t''} \int dz \sum_{jl} P_{i,jl}(z) \frac{\alpha_s(t'')}{2\pi} \right\}$$

- Therefore $\partial \Delta(t, t') / \partial t \propto \Delta(t, t') \rightarrow$ apply shower recursively

Parton showers and MC generators

Shower algorithm

Generate hard process with probability proportional to its parton level cross section. For each final state colored parton:

- ➊ Set scale t to Q , hard scale of the process
- ➋ Generate random number $0 < r < 1$
- ➌ Solve $r = \Delta_i(t, t')$ for t'
- ➍ i) if $t' < t_0$, no further branching and stop shower
- ➍ ii) if $t' \geq t_0$, one branching into partons j, l with energies $E_j = zE_i$ and $E_l = (1 - z)E_i$, z following the $P_{i,jl}(z)$ distribution and ϕ uniform in the interval $[0, 2\pi]$
- ➎ For each branched partons set $t = t'$ and start from (2)

Parton showers and MC generators

Initial state radiation

ISR already important in QED \rightarrow Used to determine the Z peak at LEP

- QCD coupling much larger \rightarrow QCD ISR even more important
- Specially large for small momentum transfer
- Same as final state partons *always* manifest as jets, initial state ones *always* lead to ISR

Parton showers and MC generators

Ordering variables

HERWIG

- Ordering variable $t = E^2\theta^2/2$
- Order of transverse momentum as "angular ordering"
- IR cut-off needed

PYTHIA

- There is not angular ordering
- More natural kinematics
- Unphysical increase of number of partons \longrightarrow solve by imposing veto to branchings that violate angular ordering
